

In the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (canceled).
2. (currently amended) The assembly of claim 1, wherein the first housing and the second housing are moveably connected in a longitudinal direction.
3. (currently amended) The assembly of claim 1, wherein
said first housing includes a first ~~rib~~ridge proximate a terminating end of the retention arm,
and
said second housing includes a second ~~rib~~ridge within the opening, wherein the first ~~rib~~ridge and the second ~~rib~~ridge engage one another to hold the retention arm in the opening.
4. (currently amended) The assembly of claim 3, wherein the retention arm can move longitudinally within the opening from a point where the first ridge and the second ridge engage to a point where the retention ~~an arm~~ abuts an end of the opening.
5. (canceled).
6. (currently amended) The assembly of claim 5, wherein the lower side includes contact pins for

Appl. No. 10/621,728
Amdt. Dated June 25, 2004
Reply to Office Action of May 7, 2004

providing connectivity to the PCB.

7. (currently amended) A connector assembly comprising:

a first housing having a retention arm; and

a second housing having an opening for receiving the retention arm,

wherein the retention arm is mounted in the opening and the first housing and the second housing are moveably connected~~The assembly of claim 5,~~

wherein the first housing and the second housing each have a lower side for connecting to a printed circuit board (PCB), and

wherein at least one of the lower sides includes guide pins for aligning the first housing and the second housing with the PCB.

8. (currently amended) The assembly of claim ~~4~~7, wherein said second housing further includes a guide for aligning the first housing and the second housing.

9. (currently amended) The assembly of claim ~~4~~7, wherein said first housing further includes a guide for aligning the first housing and the second housing.

10. (currently amended) The assembly of claim ~~4~~7, wherein said first housing further includes a stop for preventing the retention arm from passing completely through the opening.

11. (currently amended) The assembly of claim 17, wherein the retention arm includes a plurality of retention arms and the opening includes a plurality of openings, wherein each retention arm is mounted in an associated opening.

12. (currently amended) An adjustable pin header assembly for mounting to a printed circuit board (PCB), said assembly accepting periphery-peripheral circuit elements and providing connectivity between the periphery-peripheral circuit elements and the PCB, the assembly comprising

at least one first header having an upper side for receiving periphery a first set of peripheral circuit elements, a lower side having contact pins and guide pins extending therefrom in alignment with corresponding vias in the PCB, and a female connection mechanism; and

at least one second header having an upper side for receiving periphery a second set of peripheral circuit elements, a lower side having contact pins and guide pins extending therefrom in alignment with corresponding vias in the PCB, and a male connection mechanism;

wherein the at least one second header is secured to the at least one first header by mounting the male connection mechanism in the female connection mechanism.

13. (original) The assembly of claim 12, wherein the at least one first header and the at least one second header can move longitudinally with respect to one another.

14. (original) The assembly of claim 12, wherein the male connection mechanism can move longitudinally within the female connection mechanism.

15. (currently amended) A printed circuit board (PCB) assembly comprising

a PCB; and

a movable pin header assembly connected to the PCB, wherein the movable pin header assembly includes a first header having a male connection mechanism formed therein and a second header having a female connection mechanism formed therein and the first header and the second header are mounted together,

wherein the first header and the second header each have a lower side for connecting to the PCB, and

wherein at least one of the lower sides includes guide pins for aligning the first header and the second header with the PCB.

16. (original) The assembly of claim 15, wherein said PCB includes vias and said movable pin header assembly includes pins in alignment with the vias.

17. (original) The assembly of claim 16, wherein the first header and the second header can move longitudinally with respect to one another prior to connection to the PCB to allow for alignment of the pins and the vias.

18. (currently amended) A method for manufacturing an adjustable pin header assembly, the method comprising:

fabricating a plurality of headers, wherein at least a first subset of the plurality of headers include a female connection mechanism and at least a second subset of the plurality of headers ~~115~~ include a male connection mechanism; and

connecting at least a first header having a male connection mechanism to at least a second header having a female connection mechanism, wherein the first header and the second header can move longitudinally with respect to each other,

wherein the first subset of the plurality of headers and the second subset of the plurality of headers each have a lower side for connecting to a printed circuit board (PCB), and

wherein at least one of the lower sides includes guide pins for aligning the first subset of the plurality of headers and the second subset of the plurality of headers with the PCB.

19. (original) The method of claim 18, wherein the male connection mechanism can move within the female connection mechanism to allow the first header to move longitudinally with respect to the second header.

20. (original) The method of claim 18, wherein each of the plurality of headers is fabricated independently of each other.

21. (original) The method of claim 18, wherein said fabricating includes

fabricating a housing for each of the headers, wherein each of the housings include receptacles for receiving pins; and

inserting pins in appropriate receptacles in the housings, wherein the pins are used to connect the headers to a printed circuit board.

22. (original) The method of claim 21, wherein at least a subset of the housings have a male connection mechanism formed therein and at least a subset of the housings have a female connection mechanism formed therein.

23. (original) The method of claim 18, wherein the male connection mechanism is a retention arm and the female connection mechanism is an opening.

24. (original) The method of claim 23, wherein the retention arm includes a first ridge formed proximate a terminating end and the opening has a second ridge formed therein.

25. (original) The method of claim 24, wherein said connecting includes inserting the retention arm in the opening until the first ridge passes the second ridge.

26. (original) The method of claim 25, wherein the retention arm can move within the opening from a point where the first ridge and the second ridge engage to a point where the terminating end of the retention arm abuts a terminating end of the opening.
